"Debugging is twice as hard as writing the code in the first place. Therefore, if you write the code as cleverly as possible, you are, by definition, not smart enough to debug it."

- Brian W. Kernighan and P. J. Plauger in The Elements of Programming Style

CSE102 Computer Programming with C

2020-2021 Spring Semester

Simple Data Types

© 2015-2021 Yakup Genç

Overview

- Standard data types
 - char, int, double, etc.
 - logical values
- Define new data types
 - enumerated types
- Passing functions as a parameter to subprogram

April 2021 CSE102 Computer Programming

1

Representation of Numeric Types

- Why more than one numeric type?
 - integers
 - faster
 - · less space
 - precise
 - double
 - · larger interval (large and small values)

type int format

type double format mantissa exponent

binary number

```
Representation and Conversion of char

• ASCII

• numeric code (32 to 126 printable and others control char)

• constant:

'a'

• variable:

char letter;

• assignment:

letter = 'A';

• Comparison: == , != , < , > , <= , >=

if (letter > 'A')

• Relation with integer

• compare

• convert
```

```
Print Part of Collating Sequence

1. /*
2. * Prints part of the collating sequence
3. */
4. 
5. #include <stdio.h>
6. 
7. #define START_CHAR* '
8. #define END_CHAR '2'
9. 
9. 
10. int
11. main(void)
12. (

```

Enumerated Types

Defines new data type

typedef enum { sunday, monday, tuesday, wednesday, thursday, friday, saturday} day_t;

- day_t is a new type
 - has seven possible values
- sunday is an enumeration constant represented by 0
 - similarly, monday = 1, tuesday = 2, etc.

CSE102 Computer Programming

9

Enumerated Types

General syntax:

typedef enum { identifier list } enum_type;

enum_type variable_identifier;

April 2021

```
{ sunday, monday, tuesday, wednesday,
                  tuesday, friday, saturday}
                day_t;
                day_t today;

    today is of type day_t

            • manipulated as other integers
              today = sunday
              today < monday
                                              CSE102 Computer Programming
10
```

Enumerated Types

```
Enumerated Types
 { sunday, monday, tuesday, wednesday, tuesday, friday, saturday}
day_t;
day_t today;
if (today == saturday)
        tomorrow = sunday
else
        tomorrow = (day_t)(today + 1)
today = friday + 3;
                            CSE102 Computer Programming
```

```
Enumerated Type for Budget Expenses

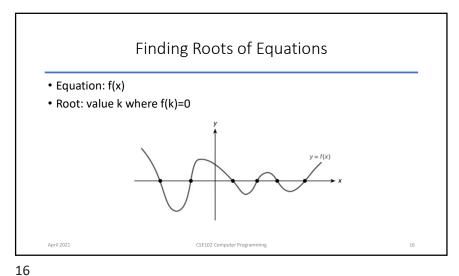

1. /* Program demonstrating the use of an enumerated type */
2. #include <stdio.h>
4. typedef enum
{entertainment, rent, utilities, food, clothing, automobile, insurance, miscellaneous}
expense_t;

9. void print_expense(expense_t expense_kind);
11. int
13. main(void)
14. {
    expense_t expense_kind;
    fo. scanf("%d". #expense_kind);
    printf("%xpense_code represents ");
    return (0);
23. }

Case Study: Bisection Method

- Problem: Find approximate root of a function on an interval that contains an odd number of roots
- Analysis

April 2021

• Change of sign in the interval: odd number of roots

Case Study: Bisection Method

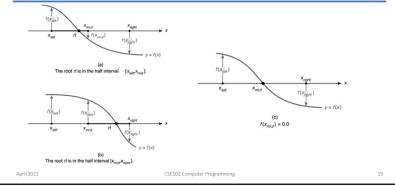

- Problem: Find approximate root of a function on an interval that contains an odd number of roots
- Analysis
 - Assume change of sign in the interval [x_left, x_right]
 - only one root
 - Assume f(x) is continous on the interval
 - Let x_mid = (x_left + x_right) / 2.0
- Three possibilities
 - root is in the lower half
 - root is in the upper half
 - f(x mid) = 0

April 202

CSE102 Computer Programming

17

Three possibilities

Finding Roots of Equations

- · Bisection method:
 - Generate approximate roots until true root is found
 - or the difference is small (less than epsilon 0.00001)
- Bisection function is more usable if can find the root of any function
 - Function should be a parameter to the bisection function

April 2021

SE102 Computer Programming

Function Parameter

- · Declaring a function parameter
 - including function prototype in the parameter list
 - as in the following evaluate function

```
1. /*
2. * Evaluate a function at three points, displaying results.
3. */
4  void
5. evaluate(double f(double f_arg), double pt1, double pt2, double pt3)
6. {
7.    printf("f(%.5f) = %.5f\n", pt1, f(pt1));
8.    printf("f(%.5f) = %.5f\n", pt2, f(pt2));
9.    printf("f(%.5f) = %.5f\n", pt3, f(pt3));
10. }
```

 Calling the function evaluate(sqrt, 0.25, 25.0, 100);

uter Programming 21

Case Study: Bisection Method

- Inputs:
 - x_left double
 - x_right double
 - epsilon double
 - funtion double f (double farg)
- Outputs

22

- root double
- error int (indicating possible error in computation)

April 2021 CSE102 Computer Programming

21

21

Bisection Method: Algorithm

```
if the interval contains even number of roots
set error flag
else
clear error flag
repeat while interval is larger than epsilon and root not found
compute function value at the midpoint
if the function value is zero
the midpoint is the root
if the root is in left half
change right end to midpoint
else
change left end to midpoint
return the midpoint as the root
```

```
Finding Root Using Bisection Method
